Front Desk System - Test Coverage Report

DDP-183 | Issue #84 | Evidence update: 27 October 2026

1. Scope of verification

This report summarizes test coverage recorded by the backend and frontend CI pipelines. Unit-test coverage is calculated only over the instrumented source set configured in Jest; PostgreSQL integration and HTTP end-to-end test counts are reported separately. These results were obtained on the specified commits, not the later documentation-only evidence commit.

2. Automated execution summary

Suite	Suites	Passed	Failed	Tested commit
Backend Jest unit	67	513	0	e590326
Backend PostgreSQL integration	9	53	0	e590326
Backend HTTP E2E	10	140	0	e590326
Frontend Jest	43	197	0	1065617

3. Coverage measurements

Codebase	Statements	Branches	Functions	Lines
Backend	96.19%	87.15%	96.85%	96.23%
Frontend	89.96%	81.33%	92.41%	89.85%

All four measured Jest coverage metrics exceeded the configured 80% gate in the applicable CI jobs. This does not separately establish changed-lines or diff coverage, which has not been measured.

4. Source and reproducibility

• Backend CI: https://github.com/forever-hotel/front-desk/actions/runs/40530366600

• Frontend CI: https://github.com/forever-hotel/front-desk/actions/runs/40534533200

• Docker CI: https://github.com/forever-hotel/front-desk/actions/runs/40534533251

• Backend coverage artifact: front-desk-backend-coverage-129; GitHub Actions run 40530366600.

• Frontend coverage artifact: frontend-coverage; GitHub Actions run 40534533200.

• Configuration: backend/jest.config.ts and frontend/jest.config.ts; reproducible installs through npm ci.

5. Evidence status and limitations

• Frontend full dependency audit on the tested commit returned zero vulnerabilities after undici was updated to 8.12.2; security controls are addressed in the OWASP evidence.

• The backend and frontend measurements were collected on separate successful commits. The final evidence commit a6050dd adds test artifacts only and has not been represented as another coverage run.

• Results apply to automated test scopes, not to real-user public staging, physical printer, live payment or live centralized authentication.

• The acceptance target for 80% coverage applies to configured instrumented code. A dedicated changed-code coverage computation was not evidenced.

6. Additional local test evidence

Verification	Observed result	Boundary
Core lifecycle	35 PASS / 0 FAIL	Disposable PostgreSQL, localhost FDS; synthetic records
Realtime baseline	14 PASS / 0 FAIL / 5 BLOCKED	Disposable RabbitMQ and Socket.IO
Phase B - real WKMS boundary	3 PASS / 0 FAIL / 3 BLOCKED	Local actual WKMS consumer / escalation outbox
Phase C - broker restart	5 PASS / 0 FAIL / 3 BLOCKED	Controlled disposable broker restart
Phase D - browser UX	8 PASS / 0 FAIL	Development browser; test messages
WKMS manual assignment	6 PASS / 0 FAIL / 2 BLOCKED	Local WKMS REST; task creation / worker discovery pending
Read-only API performance	15 PASS / 0 FAIL	1,800 successful requests against disposable DB

These checks supplement, rather than change, unit coverage percentages. Individual scope limits and deferred checks remain recorded in their original evidence files.
