Front Desk System - Performance Test Results

DDP-183 | Issue #84 | Local verification: 27 October 2026

1. Test environment

Fresh disposable PostgreSQL 16 on localhost:55436, FDS NestJS HTTP on localhost:4308, Node.js v24.21.0 and Windows 10 (win32 10.0.19045). Measured against the application revision 1065617; evidence committed as a6050dd. Test records were deterministic and synthetic. Test-only receptionist JWT for protected GET routes; no centralized authentication service.

2. Method

Five read-only GET endpoints. Each of the three concurrency levels (1, 5, 10) used 12 warm-up and 120 measured requests per endpoint. A request was counted successful when the expected response status and shape were returned; latency and throughput are local observations, not contractual service targets. Timeout: 7 seconds.

3. Summary

Scenarios	Requests	HTTP errors	Highest case p95	Highest case throughput
15 / 15 passed	1,800	0 (0%)	153.23 ms	1,016.85 requests/s

4. Detailed measured results

Case	Conc.	Requests	p50 ms	p95 ms	RPS	Errors
PERF-01-C1	1	120	3.89	10.30	177.09	0%
PERF-01-C5	5	120	8.29	32.93	393.07	0%
PERF-01-C10	10	120	20.80	41.77	347.52	0%
PERF-02-C1	1	120	5.64	14.38	129.74	0%
PERF-02-C5	5	120	10.19	30.21	384.83	0%
PERF-02-C10	10	120	21.44	44.89	418.67	0%
PERF-03-C1	1	120	4.17	8.77	180.79	0%
PERF-03-C5	5	120	9.71	16.76	478.06	0%
PERF-03-C10	10	120	64.92	153.23	136.87	0%
PERF-04-C1	1	120	4.93	13.90	148.36	0%
PERF-04-C5	5	120	9.35	23.73	444.58	0%
PERF-04-C10	10	120	18.95	58.15	426.10	0%
PERF-05-C1	1	120	1.67	4.87	466.30	0%
PERF-05-C5	5	120	4.39	8.30	1016.85	0%
PERF-05-C10	10	120	12.28	23.54	679.97	0%

5. Endpoint mapping

PERF-01: Database readiness - GET /health/ready

PERF-02: Room status board - GET /rooms/status

PERF-03: Recent bookings - GET /bookings/recent?limit=5

PERF-04: Booking search - GET /bookings/search?query=CI

PERF-05: Realtime contract - GET /realtime/contract

6. Interpretation

All 1,800 measured requests succeeded, and the final runner returned a successful execution status. The greatest recorded p95 was 153.23 ms (recent bookings, concurrency 10). The greatest recorded case throughput was 1,016.85 requests/s (realtime contract, concurrency 5). Results varied across concurrency levels and are not extrapolated to production capacity.

7. Limitations and pending non-functional acceptance

• Tests ran on an operator workstation against a small, deterministic local fixture; actual hotel data volumes, deployment hardware and traffic were not represented.

• No HTTPS, API Gateway, public staging, Neon, RabbitMQ, WKMS or FOSS was used in this performance run.

• All requests were GET-only. There are no write-load measurements for bookings, check-in, checkout or payments.

• Actual Socket.IO event delivery latency and WKMS integration latency were not measured by these GET endpoint cases.

• Numeric SRS/NFR performance thresholds were not supplied with this execution evidence; overall NFR compliance is not asserted.

8. Reproducibility and evidence

Runner: scripts/verification/fds-final-qa/run-fds-performance.cjs.

Raw results: evidence/fds-final-qa/performance/performance-results.json.

Case execution register:
